EVs don't solve the problem

Sadly, we see the continuation of outdated, environmentally devastating highway expansions that displace people, businesses, and communities. Louisiana's car insurance and electricity rates continue to rise: **problems EVs will perpetuate**.

Worst of all, EVs don't address traffic, which is the biggest problem commuters (workers and students) face in their day-to-day lives.

Maybe adding more lanes to Siegen will solve the problem?

Instead of government handouts to union-busting Tesla, we should demand a policy that favors **unionized** labor building public transit guaranteed by a federal jobs program as proposed in the **Green New Deal**.

As Baton Rouge grows, congestion worsens and sustainable solutions are desperately needed. A **robust public transportation system** would provide an option for those who don't drive and reduce traffic for those who must.

Cars vs. a bus. Now imagine a train!

Oil dependence shapes US foreign policy from the Middle East to Latin America, and much of our electricity still comes from **fossil fuels**. EVs also rely on lithium and other minerals found on indigenous lands and Africa. The US has already attempted a coup in Bolivia for access to lithium mines there. EVs may simply transition us from one **unsustainable, imperial system to another**.

The transition to a **green, low-carbon economy** is happening. But there are a few ways it could go...

A lot of focus has been on incentivizing single-occupancy electric vehicles (EVs). EVs may play an important role in a green future, but it is a mistake to emphasize these over developing **reliable public transit options**.

Are Electric Cars the future of green transportation?

A Better World is Possible.

Mass public transit is the **only sustainable system** for Baton Rouge and the world. Baton Rouge Democratic Socialists of America are fighting for a better world *for everyone*.
